# Avatr Vision Xpectra

24/04/2026

The Vision Xpectra, shown by Avatr at Beijing 2026 and later in Paris ahead of its European arrival in 2027, is a stretched, sculpted saloon with an upright A-pillar and a distinctive LED signature. What is singular is that **the exterior lighting and sensors respond to the movement** of whoever approaches.

The interior is organised as a "crystal" architecture: a central "vortex" houses an AI entity that communicates through light and motion, and lamellae run across the dashboard and into the doors. Avatr has given no dimensions or technical data.

For interior decoration, the Xpectra condenses two briefs that go together: translucent surfaces letting dynamic light through, and a geometric continuity (the lamellae) crossing parts from different suppliers without the change of material showing.
