CES 2026: the dashboard becomes a door-to-door screen

09/01/2026

In January, Las Vegas once again previewed what the motor shows confirmed later. Sony Honda Mobility's **Afeela 1**, arriving in California at the end of 2026 for just over $100,000, stretches the dashboard into a panoramic screen made of two panels (12.3 and 28.5 inches) reaching the passenger door, with remote PlayStation gaming and its own visual themes.

Qualcomm showed a prototype with 13 cameras and 20 speakers to demonstrate its AI assistant and assisted driving, able to react if the driver becomes unresponsive; Waymo presented the Ojai robotaxi, an electric minivan by Zeekr; and Garmin showed a proof of concept that controls the car's screen with finger gestures through Meta's neural wristband, without touching anything.

For interior decoration this means the screen stops being a rectangle slotted into a hole: the decorated panel must merge with it, hide capacitive sensors and light, and still look like wood, fabric or metal when off.
