New Trends for the NISSAN NUVU

02/04/2009

However, this vehicle has another feature that is relevant for both the car industry and plastic parts suppliers in particular. Instead of attempting to achieve modern finishes using green materials, the Nuvu uses natural fibres to create its new finishes. The use of green materials in industry is not new: they have traditionally been used for non-visible structural parts, and this is the reason why it is so difficult for today´s cars to have their own special decor and surface finishes. The Nissan Nuvu uses these materials for its innovative interior decor, with not only functional but also appearance characteristics. In addition to offering new appearance features and catering for budding demand of some OEMs for green materials, the Nuvu offers low-cost ecological solutions, easily associable with cars of the future with new drive systems.
