The LIQUION project, led by Maier, reaches the home straight

15/01/2014

The LIQUION project was founded two years ago with the aim of researching and generating knowledge about ionic liquids and their technological applications through more environmentally-friendly processes. These processes have led to new metal coverings and applications in sectors such as transport, energy and biomedicine.

The LIQUION consortium, led by MAIER, consists of a conglomerate of thirteen companies, including Cegasa, Boeing and Técnicas Reunidas, located across seven Autonomous Communities. It is supported by eight research bodies, such as the IK4 Technological Alliance, which is formed by eight Basque technology centres.

The total project budget is 7.5 million euros and it is due to last three and a half years. At present it is in its final technological stage; when it is finalised it will represent a qualitative leap forwards in new finishings. Chrome parts (one of Maier's core products) will be one of the main areas that benefit from this unparalleled Spanish research project, helping our company to continue to be a reference point in this market.
